

Lab 32 Worksheet — Windows Management Tools — Task Manager, MMC and Snap-ins

Name: _____ Date: ____

Exam objective: Use Task Manager, the Microsoft Management Console and its snap-ins to diagnose performance, inspect logs and manage devices, disks, users and tasks (Core 2 objectives 1.3 and 1.4).

Record as you go

Step	What you did	What you observed
1	Open Task Manager and record what each tab tells you: Processes, Performance, App history, Startup, Users, Details and Services.	
2	Perform a performance triage: sort Processes by CPU, then by memory, then by disk, and record the top consumer in each category.	
3	Open the Startup tab, record every high-impact startup item, and state which you would disable to improve boot time and why.	
4	Open Event Viewer and examine the System and Application logs, filtering to errors and critical events from the last 24 hours.	
5	Record the three main Windows log categories and what each contains: System for operating system events, Security for audit events, and Application for software events.	
6	Open Disk Management and record each volume with its file system, capacity, free space and status.	
7	Open Device Manager and identify any device showing a warning triangle or an unknown device, and record how you would resolve it.	
8	Open Task Scheduler and examine a scheduled	

Step	What you did	What you observed
	task's trigger, action and conditions, then record how you would create a nightly backup task.	
9	Open Local Users and Groups, list the local accounts and their group memberships, and record which accounts hold administrative rights.	
10	Open Performance Monitor, add a counter for processor time and available memory, and record the values observed over one minute.	
11	Open System Configuration and record what each tab controls, then explain when a diagnostic startup is the correct troubleshooting step.	
12	Build the reference table listing every tool with its launch command and its primary use, and add cleanmgr, dfrgui, regedit and resmon to complete it.	

Verification

Success criterion: Your table lists at least twelve tools with the correct launch command for each; the Task Manager triage names the top CPU, memory and disk consumer; and the Event Viewer record cites at least one real error with its source and event ID.

- I completed every step in the lab.
- My result meets the success criterion above.
- I recorded my evidence (screenshots, output, completed tables).

Reflection

What surprised you in this lab?

Where would you apply this on the job?

What do you still need to revise before the exam?
