

Lab 43 Worksheet — Windows Security Configuration and BitLocker Encryption

Name: ____ Date: ____

Exam objective: Configure Windows security settings including Defender, the firewall, UAC, account policy and BitLocker encryption (Core 2 objectives 2.5 and 2.6).

Record as you go

Step	What you did	What you observed
1	Open Windows Security and record the status of every protection area: virus and threat protection, firewall, app and browser control, device security and account protection.	
2	Verify Defender Antivirus is enabled with current definitions, and record the definition version and date.	
3	Record why definition currency matters: signature-based detection cannot identify a threat whose signature it does not yet hold.	
4	Check the firewall state for all three profiles — domain, private and public — and record which are enabled.	
5	Examine the inbound rules and record how a rule is scoped by program, port, protocol and profile.	
6	Record the default firewall posture: block inbound unless explicitly allowed, permit outbound, and add exceptions only for a stated business need.	
7	Check User Account Control's configured level and record what each level prompts for.	
8	Record the difference between running as a	

Step	What you did	What you observed
	standard user and as an administrator, and why standard-user daily operation limits malware impact.	
9	Examine the local account policy and record the password length, complexity, history and lockout threshold currently enforced.	
10	Record the local users and their group memberships, and identify every account holding administrative rights.	
11	Check BitLocker status on the system volume and record the protection state, the encryption method and the key protectors in use.	
12	Record what BitLocker protects against — theft of the physical drive — and note that it requires a TPM, that the recovery key must be stored somewhere other than the encrypted machine, and that BitLocker To Go covers removable drives.	

Verification

Success criterion: Every check command returns output you have recorded; Defender is confirmed enabled with a definition date; all three firewall profiles have a recorded state; net accounts output is captured; and the BitLocker record states where the recovery key is stored.

- I completed every step in the lab.
- My result meets the success criterion above.
- I recorded my evidence (screenshots, output, completed tables).

Reflection

What surprised you in this lab?

Where would you apply this on the job?

What do you still need to revise before the exam?
