

Lab 48 Worksheet — Mobile OS and Application Troubleshooting

Name: ____ Date: ____

Exam objective: Diagnose and resolve mobile operating system and application faults including crashes, connectivity, battery and performance problems (Core 2 objectives 3.4 and 3.5).

Record as you go

Step	What you did	What you observed
1	Build the application escalation sequence in order: force close, clear the cache, clear the application data, uninstall and reinstall, then check for OS and application updates.	
2	Record the critical distinction: clearing the cache is non-destructive, while clearing application data resets the app and removes local content including saved logins.	
3	Practise the sequence on a real application, recording the exact settings path for force close, clear cache and clear data on your device.	
4	Diagnose an application that fails to launch by working the sequence, and record which step resolved it.	
5	Diagnose an application that fails to update by checking available storage, checking the network connection, and clearing the store application's own cache.	
6	Diagnose battery drain by separating the causes: background applications, a weak signal forcing the radio to maximum transmit power, high screen brightness, or a genuinely degraded battery.	
7	Use the device's battery usage screen to identify	

Step	What you did	What you observed
	the top three consuming applications, and record the figures.	
8	Diagnose overheating by separating sustained high load, a charging fault, an ambient heat source and a failing battery, and record that a swollen battery is an immediate safety stop.	
9	Diagnose connectivity faults with a fixed sequence per technology: toggle airplane mode, forget and rejoin the Wi-Fi network, unpair and re-pair the Bluetooth device, then reset network settings.	
10	Record what resetting network settings actually does — it clears all saved Wi-Fi networks, Bluetooth pairings and VPN configurations — so the user must be warned before you do it.	
11	Build the security symptom map: high network traffic, sluggish response, data cap notifications, unexpected ads, fake security warnings and unfamiliar applications.	
12	Record the causes behind those symptoms — sideloaded APKs from outside the official store, a rooted or jailbroken device, application spoofing, or developer mode left enabled — and the response for each.	

Verification

Success criterion: Your sequence orders the five application steps from least to most destructive; the cache-versus-data distinction is stated with its consequence; the battery record names the top three consumers with figures; and every security symptom has a named cause and response.

- I completed every step in the lab.
- My result meets the success criterion above.
- I recorded my evidence (screenshots, output, completed tables).

Reflection

What surprised you in this lab?

Where would you apply this on the job?

What do you still need to revise before the exam?
