

Lab 20 Worksheet — Building and Configuring a Linux Virtual Machine

Name: ____ Date: __

Exam objective: Provision, configure and verify a Linux virtual machine, and perform the post-installation tasks a technician must complete on any new guest (Core 1 objective 4.2).

Record as you go

Step	What you did	What you observed
1	Open https://killercoda.com/playgrounds/scenario/ubuntu and wait for the terminal to become available. This is a real Ubuntu machine with root access, running in your browser.	
2	Record the guest's identity: distribution, version, kernel and architecture — the first thing to establish on any unfamiliar machine.	
3	Record the allocated resources: CPU count, total and available memory, and disk capacity and usage.	
4	Update the package index and apply available upgrades, the mandatory first post-installation task on any new guest.	
5	Install the tool set this course uses across the Linux labs.	
6	Record the network configuration: interface addresses, the default route and the configured DNS resolvers.	
7	Verify outbound connectivity and DNS resolution in one test, then record the result.	
8	Create a standard non-root user for daily work, following the principle of least privilege.	

Step	What you did	What you observed
9	Grant that user administrative rights through sudo rather than by using the root account directly.	
10	Create a working directory structure for the course labs and confirm it was created as expected.	
11	Set correct ownership on the new directories so the standard user, not root, owns their own files.	
12	Write the build record capturing the OS version, resources, installed packages, created user and network settings, so the machine could be rebuilt identically.	

Verification

Success criterion: The OS version and resources are recorded, updates complete without error, ping and dig both succeed, the aplus user exists in the sudo group, and the labs directory tree is owned by aplus rather than root.

- I completed every step in the lab.
- My result meets the success criterion above.
- I recorded my evidence (screenshots, output, completed tables).

Reflection

What surprised you in this lab?

Where would you apply this on the job?

What do you still need to revise before the exam?
